Dive bomber
A dive bomber is a bomber aircraft that dives directly at its targets in order to provide greater accuracy for the bomb it drops. Diving towards the target reduces the distance the bomb has to fall, which is the primary factor in determining the accuracy of the drop. In these examples, accuracy of the drop is primarily a function of the accuracy of the pilot or bombardier's ability to accurately sight the target. This is aided by the fact that the aircraft is pointed towards it, making sighting over the nose dramatically easier.
