The data warehouse always contains data and information, on which management decisions can be reliably tested, analyzed, assessed and monitored using the data and information integration. A data warehouse is that portion of an overall architected data environment that serves as the single integrated source of data of information processing, and is subject oriented, integrated, time variant and non-Volatile (Inmon, 2001). Data warehouse store important data for the organization in accordance with the needs of staff that will use information. The Ministry of Health, for example, has among his objectives, to provide sanitary services to the community. For this, data warehouse must have an architecture that allows gathering, manipulation and...
