The Western Australian Aboriginal Child Health Survey is the first population based survey of its kind developed specifically to inform policy and planning to improve the developmental health of Aboriginal children and youth. A random representative sample of 5,289 Aboriginal children aged 0-17 years, including 1,480 adolescents aged 12-17 years was surveyed through household based interviews with carers and adolescents, questionnaire data from schools and consensual record linkage to health service and education system data. The Western Australian Aboriginal child health survey: Improving the educational experiences of Aboriginal children and young people. Perth, Australia: Curtin University of Technology and Telethon Institute for Child Health Research. Recommend this journal. Email your librarian or administrator to recommend adding this journal to your organisation's collection. The Western Australian Aboriginal Child Health Survey (WAACHS) was the largest and most comprehensive survey ever undertaken into the health, wellbeing and development of Western Australian Aboriginal and Torres Strait Islander children. The survey was designed to build the knowledge to develop preventative strategies that promote and maintain the healthy development and the social, emotional, academic and vocational wellbeing of Aboriginal and Torres Strait Islander children and young people. Vol 3: Improving the educational experiences of Aboriginal children and young people. Vol 4: Strengthening the capacity of Aboriginal children, families and communities. Technical papers.
