Belief in conspiracy theories is linked to increased hostility and radicalisation, while supernatural beliefs may lead people to hand over money to spiritual healers or tarot card readers. Uncertain times breed these kinds of beliefs, which can be seen as ways to make an unpredictable and potentially threatening environment feel more predictable. Supernatural beliefs are defined as beliefs that violate scientifically founded principles of nature, including superstition, belief in the paranormal, horoscopes, and telepathy (Lindeman & Aarnio, 2007). If you want to study "irrational beliefs", you better make sure that those beliefs are known falsities beyond reasonable doubt.
